

Algalithe G

MARINE NUTRITIONAL COMPLEX

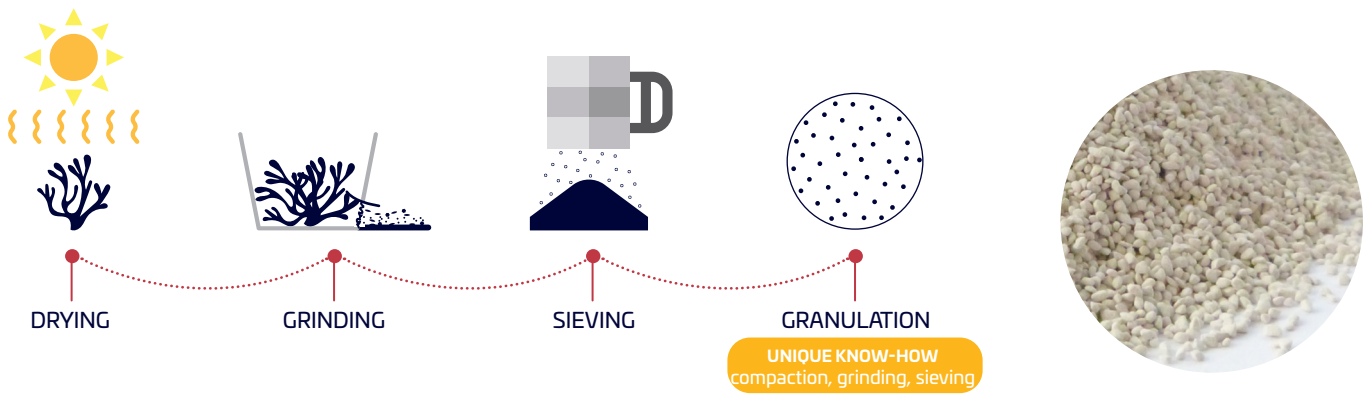

DESCRIPTION

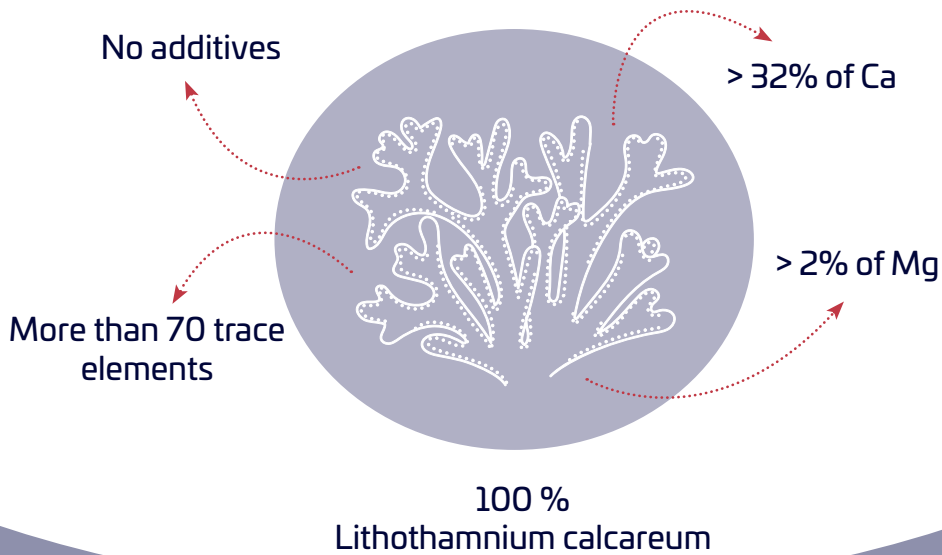

Declaration : Algae Phymatolithon calcareum or algae Lithothamnium calcareum

Algalithe is obtained from fossilized red macro-algae Lithothamnium calcareum. Its microporous structure combined with its slow growth allow the absorption of all nutrients from the sea, especially calcium and magnesium.

MANUFACTURING PROCESS

TECHNICAL CHARACTERISTICS

Particles size
100 μm < 90% < 710 μm

Good flowability and
compressibility

Applications : tablets
and capsules

Dosage : 2,5 to 2,7 g per day
to reach calcium's RDA
